## Ryegrass TranStar

TURF SEED

TransStar was developed as an attractive overseed alternative to traditional annual and perennial ryegrass mixes. It is suitable for oversowing warm season grasses before they become dormant. This enhances appearance and protects the dormant turf from wear. This provides a quick high quality temporary cover which transitions when the warm season grasses become active.

TransStar is used to provide improved surfaces particularly on Couchgrass sporting surfaces during winter and to fade away as the weather becomes more suitable to the warmer season grasses. TransStar is used to oversow couchgrass and Kikuyu on ovals, fairways and other turf areas where use will deteriorate the surface or where a green lush appearance is a priority

### Features

- Combines turf quality of perennial with quick transition of annual ryegrass
- Dark green colour, quick germination
- Medium leaf texture
- Compact growth habit
- Improved mowing quality
- Excellent for use with perennial ryegrass
- Ideal oversowing grass for couch & Kikuyu
- Improved mowing quality and appearance

### Establishment & Maintenance

Prior to sowing an application of Primo growth regulator will slow the rate of growth of the base grass to allow the germinating seed to establish. It allows the new shoots of the germinating seed to get light without being blanketed by the faster growing established sward.

Sow the TransStar at rates of 200-400kg/Ha. Also apply Andersons turf starter at a rate of 200kg per Ha.

Emergence will appear 3 to 7 days in ideal conditions.

The first mowing is best scheduled 10 to 14 days after emergence
